**Subject: 2015 Fourth Quarter Progress Report, Former Warner Electric Clutch and Brake Facility, Roscoe, Illinois (RCRA-05-2013-0005)**

Dear Mr. Black:

This progress report documents the results of groundwater monitoring activities at the former Warner Electric Clutch and Brake facility (Warner) in Roscoe, Illinois following the fourth quarter monitoring in 2015. This report is provided in accordance with the Amended Administrative Order on Consent (AAOC) between Dana Companies LLC (Dana) and the United States Environmental Protection Agency Region 5 (USEPA), dated April 17, 2013. This report supports the USEPA letter of June 17, 2014, which found that the project has successfully completed construction of the remedy, which is designed to achieve long term protection of human health and the environment (CA550 – event code).

Overall, the monitoring results are consistent with past sampling events. On-site source area and long term monitoring wells show chlorinated volatile organic compound (CVOC) concentrations well below the Intermediate Cleanup Criteria and in some cases below the Long Term Cleanup Criteria. More importantly, long term monitoring wells at and near the facility property boundary, as well as those along Edgemere Terrace, continue to show concentrations below the Intermediate Cleanup Criteria and in most cases below the Long Term Cleanup Criteria.

As discussed during our meeting on June 11, given the long term success of remedial efforts at this site, we are proposing to reduce sampling at select monitoring wells and to refocus potential contingency response actions that would be undertaken in the highly unlikely event that groundwater concentrations in monitoring wells along Edgemere Terrace were to exceed the Intermediate Cleanup Criteria. Results from this monitoring event support this request as outlined in the Recommendations Section at the end of this letter.

### **Background**

Historically, Dana conducted remedial activities at the Warner site under an Administrative Order on Consent (AOC) between the USEPA and Dana, dated December 28, 1989. During most of the time the AOC was in place, remediation was accomplished through the capture and treatment of affected groundwater near the Rock River, approximately 1.25 miles downgradient from the Warner facility (Figure 1). However, the system became increasingly inefficient and ineffective as concentrations of hazardous constituents, primarily trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE), decreased over time. By 2007, influent concentrations had decreased to a level below the National Pollution Discharge Elimination System (NPDES) permitted effluent limits, and the system no longer provided any substantive remedial benefit.

At this point, Dana approached the USEPA and requested an amendment to the AOC to refocus remedial activities to the Warner facility where residual impacts remained. As part of this effort, Dana developed the 2007 Work Plan that employed enhanced reductive dechlorination (ERD) and soil vapor extraction (SVE) to address residual subsurface impacts at the facility, and groundwater monitoring to document the success of remedial efforts. In 2009, following revisions to address USEPA comments, a final version of the Work Plan was approved by the USEPA.

In 2010, the USEPA issued a Statement of Basis outlining historic remedial efforts at the site and revised the planes of performance for long-term remediation at the site.

To expedite remediation of the facility, Dana voluntarily undertook the remedial efforts outlined in the Work Plan prior to the promulgation of the revised AOC. In April 2010, an ERD program, consisting of 300 injection points was implemented and the SVE system was brought on-line. The SVE system operated until September 2011, when influent sampling showed the system had reduced concentrations by a factor of nearly 9,000x and little rebound was noted following system shutdown. In 2013, when groundwater levels rose following a drought, TCE concentrations in the source area increased. To address this, Dana conducted a supplemental ERD program, which returned CVOC concentrations to levels well below the Intermediate Cleanup Criteria. Also in 2013, the AAOC, which provides the current regulatory framework for continued remedial activities, was implemented.

The AAOC uses the existing groundwater treatment system as a contingency in the event that results from monitoring wells on Edgemere Terrace exceed the Intermediate Cleanup Criteria. However, as noted in the 2009 Work Plan and the USEPA Statement of Basis (USEPA, 2010), the groundwater treatment system has reached the end of its effective life. It is highly wasteful of water, energy inefficient, and does nothing to reduce CVOC concentrations. Nevertheless, Dana appreciates the need to retain a contingency that can be relied upon to reduce CVOC concentrations to levels below the Intermediate Cleanup Criteria in the unlikely event the CVOC concentrations in monitoring wells on Edgemere Terrace were to exceed the criteria. To this end, we propose use of enhanced reductive dechlorination (ERD) as a more appropriate and proven remedial contingency that would reduce CVOC concentrations, not simply capture them. This contingency is addressed in more detail in the recommendations section of this letter.

### **Groundwater Monitoring**

Since 2009, groundwater monitoring has been conducted quarterly at a series of 19 monitoring wells in accordance with the 2009 Work Plan. Figure 2 depicts location of the monitoring wells relative to the facility and the Rock River.

During the week of December 14 to 18, 2015, Dana collected quarterly groundwater samples from 19 monitoring wells. As in the past, samples were collected using low-flow sampling techniques with a bladder pump. Stabilization was accomplished with field readings of pH, specific conductance, temperature, dissolved oxygen, and ORP. Following stabilization, laboratory-supplied sample containers were filled directly from the pump discharge without filtration. Samples were stored on ice prior to delivery to the PACE Analytical Services, Inc., (PACE) for laboratory analysis of the site-related CVOCs and total chromium. Quality control samples included field duplicates and rinse blanks (10 percent of the samples collected), trip blanks (one per cooler), laboratory method blanks, and surrogate spike samples.

Tables 1 through 4 present tabulated summaries of the field and laboratory analysis. Figures 3 through 22 present time concentration graphs for TCE and cis-1,2-DCE. Attachment A contains the laboratory analytical report. Following are pertinent observations regarding the results and trends noted on the figures and tables.

On-site Source Area Wells MW-101 through MW-107 (Table 1, Figures 3 through 9):

- Wells MW-101 and MW-102 (Figure 3 and Figure 4) showed low concentrations of TCE that were within historic post-injection concentration range.
- Wells MW-103 and MW-104 (Figure 5 and Figure 6) where increases in TCE concentrations were reported in the second quarter of 2013 and 2014, showed small increases in concentrations with 58.8 and 57.2 µg/L, respectively. However, ORP (16 and -11 mVolts) and dissolved oxygen (2.9 and 3.2 mg/L) remain low, which shows conditions continue to be favorable for reductive dechlorination.
- MW-105 (Figure 7), continued to report only a trace TCE concentration (0.43 µg/L). However, the vinyl chloride remained elevated at 33.7 µg/L. As the aquifer returns to aerobic conditions, it is anticipated that vinyl chloride will undergo aerobic oxidation or cometabolism to decrease concentrations below the Long Term Cleanup Criteria. Vinyl chloride has not been detected in the downgradient wells on Hononegah Road or Edgemere Terrace. Table 1 and Figure 7 also show that the TCE concentration increases observed in during the second quarter of 2013 and 2014 in wells MW-103 and MW-104 was reflected with concentrations no higher than 51 µg/L and 16 µg/L in MW-105. This demonstrates a strong degree of natural attenuation immediately down gradient of the source area between MW-103 and MW-105.
- Wells MW-106 and MW-107 (Figure 8 and Figure 9) continue to show trace to low TCE concentrations (less than 10 µg/L) with stable conditions.
- Quarterly monitoring results and trends in these wells over the past five years clearly reflect long-term MNA.

On-site Long-term Monitoring Wells - LTMW-01, -02, -03, and -03A (Table 2, Figures 10 through 13):

- Wells LTMW-01 and LTMW-02 (Figure 10 and Figure 11) continue to meet the Long Term Cleanup Criteria for all CVOCs.
- Wells LTMW-03 (Figure 12, a shallow monitoring well) and LTMW-03A (Figure 13, a deep monitoring well) reported low TCE concentrations (15.3 and 14.9 µg/L), slightly above the Long Term Cleanup Criteria for TCE (5 µg/L). Vinyl chloride concentrations of 19.8 and 5.6 µg/L, while above the Long Term Cleanup Criteria (2 µg/L), remain stable. The presence of vinyl chloride reflects reductive dechlorination. As the aquifer returns to aerobic conditions, it is anticipated that vinyl chloride will undergo aerobic oxidation or cometabolism to decrease concentrations below the Long Term Cleanup Criteria within the next several monitoring events.
- Quarterly monitoring results and trends in these wells over the past four years clearly reflect long-term MNA.

Off-site Long-term monitoring Wells on Hononegah Road - LTMW-04, -05, -06, -07 (Table 3, Figures 14 through 18):

- The wells along Hononegah Road continue to show stable conditions. Figure 14 depicts the long term TCE concentration trend at this location, using both the original well (N1-60), which was abandoned in 2005, as well as the new long term monitoring wells installed in 2009 (LTMW-04 through -07). The figure shows there has been a dramatic reduction in TCE concentration over time. In the late 1980s TCE concentrations ranged from 1,000 to 1,400 µg/L (these high concentrations are not shown on the figure in order to maintain a useful scale for depicting current concentrations). In the 1990s, TCE concentrations decreased to levels below 500 µg/L. From 2000 to 2005, TCE concentrations continued to fall to levels below 50 µg/L where they remain today. Given this long term stable condition, less frequent (semi-annual) monitoring of these wells is recommended. Less frequent monitoring is particularly applicable at this location since these wells are only used to judge long term concentration trends (as opposed to the source area or Edgemere Terrace, where monitoring results may be used to trigger a contingency response).
- Figure 15 and Figure 18 show that TCE concentrations in wells LTMW-04 and LTMW-07 near the western and eastern boundary of the zone of affected groundwater, respectively, have low TCE

concentrations (10.7 µg/L at LTMW-04 and 0.34 µg/L at LTMW-07). This reflects the shrinking of the area of affected groundwater at the margins.

- Figure 16 and Figure 17 show that TCE concentrations in wells LTMW-05 and LTMW-06 were consistent with past results at 7.5 and 26.4 µg/L, respectively. This reflects stable conditions near the center of the zone of affected groundwater.
- Quarterly monitoring results and trends in these wells over the past four years, coupled with periodic monitoring dating back to 1987 clearly reflects long-term MNA and reduction in groundwater concentrations. The very stable concentrations over the past four years support a request for less frequent monitoring at these wells.

Off-site Long-term Monitoring Wells along Edgemere Terrace - LTMW-08, -09, -10, -11 (Table 4, Figures 19 through 22):

- Figure 19 and Figure 22 show that wells LTMW-08 and LTMW-11, near the western and eastern boundary of the zone of affected groundwater, respectively, continue to reflect minimal impact with TCE concentrations (less than 3 µg/L), below the Long Term Cleanup Criteria (5 µg/L). As with wells LTMW-04 and LTMW-07 on Hononegah Road, this again reflects shrinking margins of the area of affected groundwater.
- Figures 20 and 21 show that wells LTMW-09 and LTMW-10, located near the center of the zone of affected groundwater, reported TCE concentrations (6.5 and 5.8 µg/L, respectively) that are well below the Intermediate Cleanup Criteria (25 µg/L) and only slightly above the Long Term Cleanup Criteria (5 µg/L).
- The long term trends at the four monitoring wells on Edgemere Terrace, clearly reflects that stable and reducing trends in groundwater concentrations of CVOCs. The physical, chemical and biological processes acting to attenuate the low to trace concentrations that remain in the aquifer will continue to reduce concentrations to levels below the Long Term Cleanup Criteria. Although there are no reasonable circumstances that could lead to concentrations in these wells rising to levels above the Intermediate Cleanup Criteria, we appreciate the need to maintain a contingency to address this potential issue. However, the current contingency, restarting the groundwater pump and treat system, can no longer effectively or efficiently address the low to trace level CVOC concentrations that remain in the aquifer.

## Recommendations

Based on the successful remedial efforts, coupled with the long term stability in monitoring results and our June 11 meeting request, we reiterate the following requested modifications to the sampling and contingency programs.

Sampling Request – We respectfully request a reduction in the sampling frequency from quarterly to semi-annual at monitoring wells LTMW-04, -05, -06, and -07, located on Hononegah Road, where stable CVOC conditions exist.

Contingency Request – The AAOC stipulates that the groundwater remediation system on Edgemere Terrace shall be brought back on line in the event that groundwater concentrations in wells along Edgemere Terrace (LTMW-08, -09, -10, and -11) exceed the Intermediate Cleanup Criteria. However, as described in the background section of this letter, the remediation system has reached the end of its effective life. It cannot effectively or efficiently address the low to trace concentrations of CVOCs and shrinking extent of affected groundwater.

Nevertheless, we appreciate the need to maintain an appropriate contingency to address this potential issue. ERD, given its successful application at the Warner facility, would serve as such an appropriate contingency. ERD is flexible; should monitoring show that a well or group of wells was exceeding the Intermediate Criteria, an injection gallery could be designed to address these well(s). The injection gallery would be installed using direct-push drilling methods. Direct-push drilling has previously been successfully employed along Edgemere Terrace and along other streets in Hononegah Country Estates.

In addition, application of ERD would lead to the destruction of CVOCs which will reduce the CVOC concentrations, not simply capture the impacted water. Given the very low TCE concentrations along Edgemere Terrace, ERD application would generate virtually no risk of vapor intrusion. ERD is designed to work with the existing physical, chemical and biological processes that are acting to attenuate the CVOCs. Based on successful ERD efforts near the source area, we believe that this option offers a more appropriate and effective contingency to address potential increases of CVOCs in monitoring wells along Edgemere Terrace.

With your concurrence, we will prepare a brief work plan that will address the modified sampling schedule for wells on Hononegah Road as well as the contingency plan to use ERD in the event groundwater concentration along Edgemere Terrace exceed the Intermediate Criteria.

### **Conclusions**

Dana conducted quarterly groundwater sampling at 19 monitoring wells associated with the Warner facility for the last five years. Results continue to show that remedial efforts conducted at the source area have been successful. Concentrations of CVOCs are below Intermediate Cleanup Criteria and in some cases below Long Term Cleanup Criteria. Based on this success, we have requested a reduction in the sampling frequency from quarterly to semi-annual at four monitoring wells located on Hononegah Road (LTMW-04, -05, -06, and -07). In addition, we have requested approval of ERD as an appropriate contingency to address the potential for CVOC concentrations in monitoring wells along Edgemere Terrace near the Rock River (LTMW-08, -09, -10, and -11) to exceed Intermediate Cleanup Criteria.

Please do not hesitate to contact me at (608) 828-8210 if you have any questions or comments on this letter or the attached figures or tables.

Sincerely,

James A. Buss, P.G  
Project Manager

- Notes (1) Limit established in 2009 Workplan  
(2) NM indicates not measured  
(3) S\* indicates the samples was collected from the top of the water column in the well (less than 2 feet below the top of well screen).  
(4) D\* indicates the samples was collected from the bottom of the water column in the well (less than 2 feet below the bottom of the well screen).  
(5) J indicates estimated concentration. Reported result is between the method detection limit and the practical quantitation limit.  
(6) < indicates parameter was not detected above the listed method detection limit.  
(7) Red Bold values exceed the Intermediate Cleanup Criteria

Notes: (1) Maximum Concentration Level (MCL) promulgated under the Safe Drinking Water Act.  
(2) Limit established in 2009 Workplan  
(3) NM indicates not measured  
(4) < indicates analyte was not detected above the listed concentration  
(5) J indicates estimated concentration. Reported result is between the method detection limit and the practical quantitation limit.  
(6) ***Bold and Italic*** values exceed the Long Term Cleanup Criteria

RE: Project: 60343108-1 DANA ROSCOE CORP  
Pace Project No.: 40126382

Dear Jim Buss:

Enclosed are the analytical results for sample(s) received by the laboratory on December 18, 2015. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Christopher Hyska  
christopher.hyska@pacelabs.com

## PROJECT NARRATIVE

Project: 60343108-1 DANA ROSCOE CORP

Pace Project No.: 40126382

**Method:** EPA 6010

**Description:** 6010 MET ICP

**Client:** AECOM, Inc. - Middleton

**Date:** January 05, 2016

### General Information:

21 samples were analyzed for EPA 6010. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

### Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

### Sample Preparation:

The samples were prepared in accordance with EPA 3010 with any exceptions noted below.

### Initial Calibrations (including MS Tune as applicable):

All criteria were within method requirements with any exceptions noted below.

### Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

### Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

### Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

### Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

### Additional Comments:

---

**Method:** EPA 8260  
**Description:** 8260 MSV  
**Client:** AECOM, Inc. - Middleton  
**Date:** January 05, 2016

### General Information:

23 samples were analyzed for EPA 8260. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

### Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

### Initial Calibrations (including MS Tune as applicable):

All criteria were within method requirements with any exceptions noted below.

### Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

### Internal Standards:

All internal standards were within QC limits with any exceptions noted below.

### Surrogates:

All surrogates were within QC limits with any exceptions noted below.

### Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

### Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

### Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

### Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

## QUALIFIERS

Project: 60343108-1 DANA ROSCOE CORP

Pace Project No.: 40126382

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### LABORATORIES

PASI-G Pace Analytical Services - Green Bay
